

ALR# : CDC-20-17987
Pat. Name : Ahmad Hassan Malik
Age / Sex : 22Y / Male
Clinician : Dr Nadeem Zia Abbasi
Hospital :

95593

Specimen Date 29 May 2021
Report Date 29 May 2021

Covid-19 (Corona) PCR

Tests	Result	Normal Range
Specimen	Throat Swab	
Covid-19 PCR	Not Detected	Not Detected

METHOD: (TaqMan®Real Time RT-PCR Viral Load)

The 2019-nCoV (Corona) virus quantitation has been performed using a TaqMan® Real Time Polymerase Chain Reaction (RT-PCR) technology to detect and quantify COVID-19 RNA. Under optimal conditions 2019-nCoV detection kits have high efficiencies of >90% and can detect up to 100 copies of target template. .

For very early cases preferable samples are Nasopharyngeal and throat swabs.

A Non Reactive serum test result does not completely rule out the possibility of an infection with 2019 -n COV (Corona) virus. Serum Samples from very early (preseroconversion) phase, or very Late (Post decline of antibody titers) can yield Non- Reactive findings . If symptoms persist repeat Nasopharyngeal PCR within 72 hours.

Note:

Please correlate all results clinically. Continue self isolation and contact your Physician in case of Fever Cough, Shortness of breath.

Post travelling and unsafeguarded contact with a positive case practice self isolation for 2 weeks.
